Helicity is not relativistically invariant (for massive particles)

Lorentz boost

Left-handed neutrinos (ν_e, ν_μ, ν_τ) and Right-handed antineutrinos ($\bar{\nu}_e, \bar{\nu}_\mu, \bar{\nu}_\tau$) do not solve the Dirac equation.

Sterile Neutrinos

$$\begin{pmatrix} |\nu_e\rangle \\ |\nu_\mu\rangle \\ |\nu_\tau\rangle \\ |\nu_s\rangle \\ |\nu'_s\rangle \\ |\nu''_s\rangle \end{pmatrix} = U^\dagger \begin{pmatrix} |\nu_1\rangle \\ |\nu_2\rangle \\ |\nu_3\rangle \\ |\nu_4\rangle \\ |\nu_5\rangle \\ |\nu_6\rangle \end{pmatrix}$$

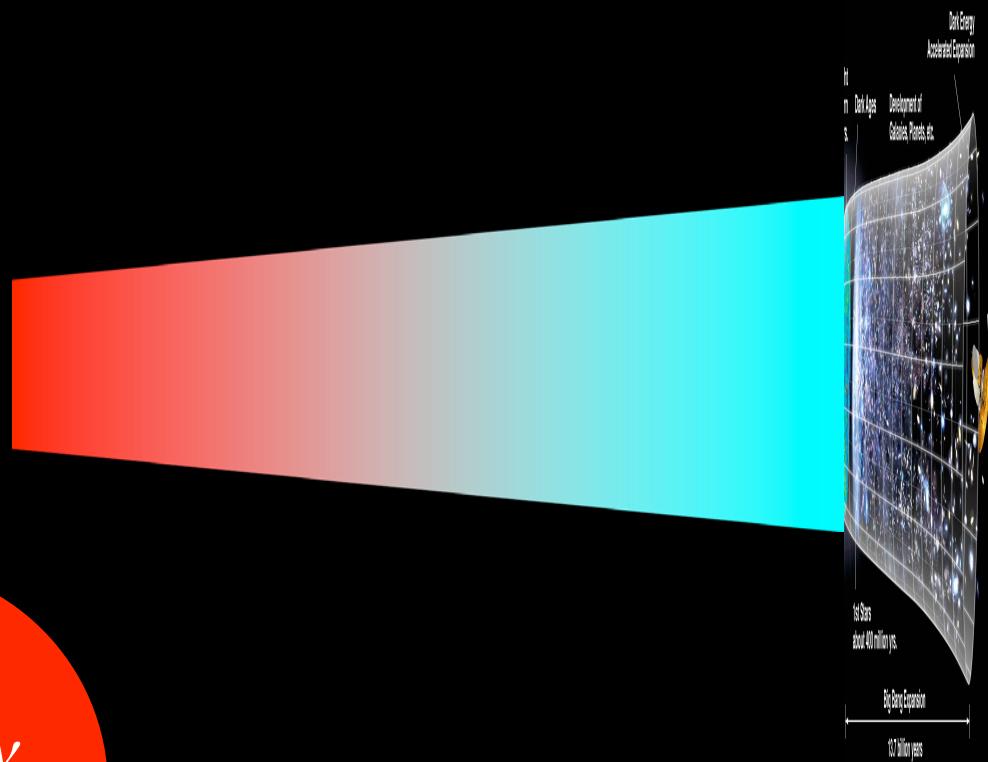

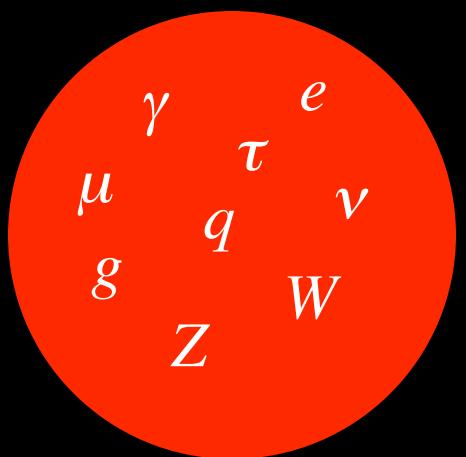

Because of oscillations with active states, “sterile” neutrinos aren’t actually sterile.

Sterile Neutrino Dark Matter

Sterile neutrino parameters:

$$m_s = 64 \text{ keV} \quad \sin^2 2\theta = 10^{-10}$$

$$|\nu_e\rangle = \cos \theta |\nu_1\rangle + \sin \theta |\nu_2\rangle$$

$$|\nu_s\rangle = -\sin \theta |\nu_1\rangle + \cos \theta |\nu_2\rangle$$

Initial lepton numbers:

$$L_{e0} = L_{\mu 0} = L_{\tau 0} = 1.1 \times 10^{-3}$$

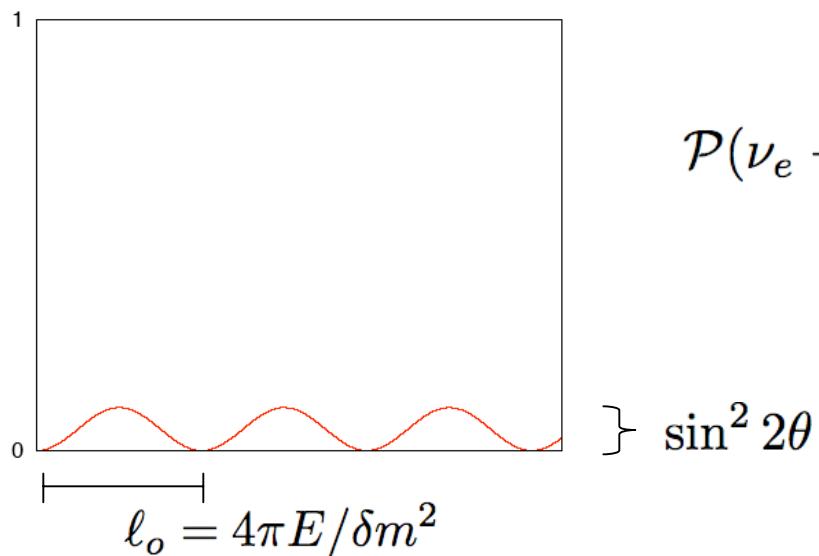

$$L_\alpha = \frac{n_{\nu_\alpha} - n_{\bar{\nu}_\alpha}}{n_\gamma}$$

Neutrino Oscillations

$$\begin{aligned} |\nu_e\rangle &= \cos\theta |\nu_1\rangle + \sin\theta |\nu_2\rangle \\ |\nu_s\rangle &= -\sin\theta |\nu_1\rangle + \cos\theta |\nu_2\rangle \end{aligned}$$

$e^{-i\varepsilon_1 t}$ $e^{-i\varepsilon_2 t}$

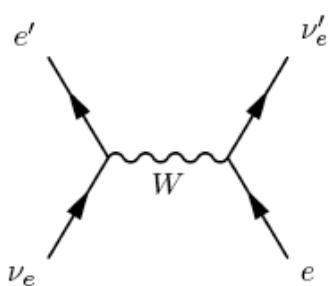

$$\varepsilon_i = \sqrt{p^2 + m_i^2}$$

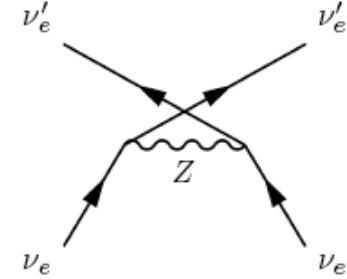

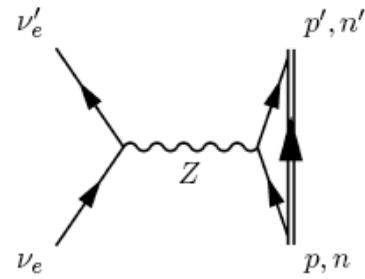

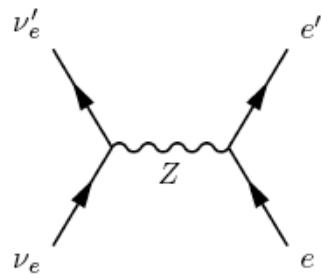

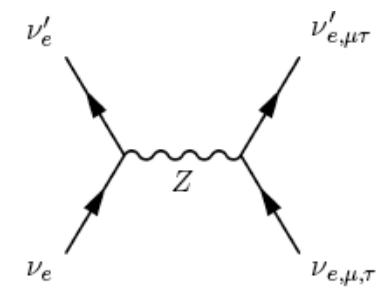

$$\mathcal{P}(\nu_e \rightarrow \nu_s) = \sin^2 2\theta \sin^2 \left(\frac{\delta m^2}{4E} t \right)$$

Matter-Enhanced Neutrino Oscillations

$$\mathcal{H}_e |\nu_e\rangle = V_e |\nu_e\rangle$$

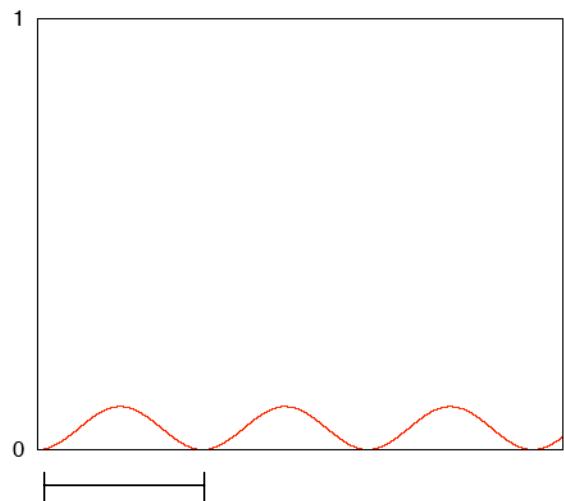

$$\mathcal{H}_e |\nu_s\rangle = 0$$

Matter-Enhanced Neutrino Oscillations

Mean Free Path

$$\lambda_{\text{mfp}} = \Gamma_e^{-1} \sim G_F^{-2} T^{-5}$$

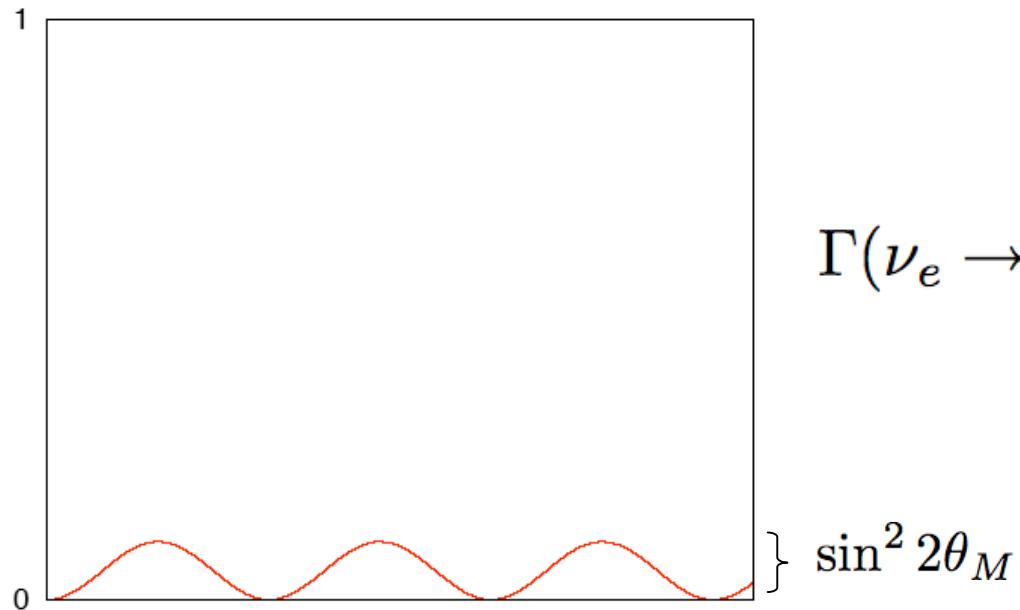

Horizon Size

$$d_H \sim H^{-1} = \sqrt{\frac{45}{4\pi^2}} g^{-1/2} \frac{m_{\text{PL}}}{T^2}$$

For $T \gtrsim 3 \text{ MeV}$, the mean free path of neutrinos in the early universe is short compared to the size of the universe. As a result, scattering dominates the quantum dynamics of the neutrinos.

Decoherent Sterile Neutrino Production

$$\mathcal{P}(\nu_e \rightarrow \nu_s) = \sin^2 2\theta_M \sin^2(2\pi t/\ell_m)$$

We examine medium-enhanced, neutrino scattering-induced decoherent production of dark matter candidate sterile neutrinos in the early universe. In cases with a significant net lepton number we find two resonances, where the effective in-medium mixing angles are large. We calculate the lepton number depletion-driven evolution of these resonances. We describe the dependence of this evolution on lepton numbers, sterile neutrino rest mass, and the active-sterile vacuum mixing angle. We find that this resonance evolution can result in relic sterile neutrino energy spectra with a generic form which is sharply peaked in energy. We compare our complete quantum kinetic equation treatment with the widely-used quantum Zeno ansatz.
